Find out who called a .NET method

When debugging, it is useful to know who called a method (if it is being called from multiple places)

Include these

```
Imports System.Reflection
Imports System.Diagnostics
```

Place this code on the beginning of the method being called.

```
Dim st As StackTrace = New StackTrace()
Dim sf As StackFrame = st.GetFrame(1)
MsgBox("I was called by: " & sf.GetMethod.Name)
```
