Transfer or seize FSMO roles

```
ntdsutil
roles
connections
connect to server <FQDN of role holder>
quit
seize schema master
seize naming master
seize RID master
seize PDC
seize infrastructure master
quit
quit
```

Use **transfer** keyword instead of the **seize** keyword, if the old DC is accessible

Open Active Directory Sites and Services, expand tree <site name> \ Servers \ <server name>

Open properties on NTDS Settings, and remove the tick from 'Global catalog' checkbox
