# Get event data from event triggered task

- Create task
- Export task into XML
- Add the following: into Task/Triggers/EventTrigger

```
<ValueQueries>
  <Value name="User">Event/EventData/Data[@Name='TargetUserName']</Value>
  <Value
name="Computer">Event/EventData/Data[@Name='TargetDomainName']</Value>
</ValueQueries>
```

- Reimport the task
- Use $(User) and $(Computer) as variable names
